

Natural language

"Always, whenever case1 happens, the robot must move to place2 and finish task3."

AST (pseudo-code)

```
imply(  
  atom case1,  
  and(atom move_to_place2,  
       atom finish_task3))
```

Round-trip STL

$(\text{case1}) \rightarrow (\text{move_to_place2} \wedge \text{finish_task3})$
